MOUSE OUT®

MICE NO MORE.™

REFERENCE GUIDE

To keep mice out and put an end to infestations

MOUSE OUT® REFERENCE GUIDE

To help prevent intrusions, it is important to use a combination of preventive and deterrent measures. If, despite your efforts, mice manage to get inside, it is essential to act quickly and use solutions that deliver fast results. Remember that mice are seldom alone, and that these small rodents can multiply at an alarming rate.

Here's everything you need to know to properly protect your property.

PREVENTING INTRUSIONS

Inspect and seal

- Cracks and holes in the exterior foundation, as well as damaged mortar.
- Openings in the exterior siding.
- Gaps between the soffits and the roof.
- Window screens, weatherstripping around exterior doors and garage doors, and caulking around windows and door frames.
- Air vents and exhaust outlets, cable entry points, water or gas pipes, air-conditioning equipment, etc.

Keeping mice out of your home | Wilson Control

Adopt good habits

- Avoid leaving garage doors, shed doors or doors to other outbuildings open.
- Do not leave food outdoors, including pet food.
- Keep outdoor garbage can lids tightly closed.
- Keep grass trimmed along the foundation.
- Trim tree branches and shrubs that touch the building and provide rodents with easy access to the attic.
- Declutter the garage, basement, attic and yard. A clean and tidy home is less attractive to mice!
- Place bird feeders away from the house.
- Store firewood away from the house (woodpiles provide shelter for mice).

Eliminate indoor attractants

- Clean up crumbs and food scraps from floors and countertops.
- Always transfer food sold in flexible or cardboard packaging to airtight plastic, glass or metal containers, including pet food and birdseed.
- At night, put away your pets' food bowls and empty their water bowls completely.
- Regularly clean behind and underneath appliances.
- Manage kitchen waste and recycling daily. Store them in sealed outdoor garbage cans.
- Eliminate all potential sources of water, such as leaking faucets, dripping pipes, etc.

Use rodent control solutions

- Deter intrusions and prevent nesting with ultrasonic pest repellers.
- Set up traps as a preventive measure in areas you rarely visit, such as the attic.
- Place bait stations in areas where rodent activity is present (our rodenticides cause rapid mummification, which helps limit odours).

Which products to choose to PREVENT MICE

MOUSE OUT® Rodent Sonic-Repel Max Battery Operated

WHY

To repel mice and rats from indoor areas using a device that emits ultrasonic waves that disturb rodents and keep them at a distance.

WHERE

In any indoor space. Anywhere in the home, shed or other outbuildings, garage, cottage, boats, recreational vehicles, rental properties, agricultural or farm buildings, etc.

ACTION

Produces powerful ultrasonic waves that are inaudible to humans and most pets, but intolerable to mice and rats, keeping them away from protected areas.

BENEFITS

- Portable generator powered by three AA batteries that can be used anywhere (no power outlet required)
- No poison or chemicals
- Covers five times more area than a traditional device (232 m^2 or 2,500 ft^2)

TIP

Placement of the device is important. Ultrasonic waves travel in a straight line and bounce off non-absorbing materials to fill a room. Hard surfaces such as walls, doors, appliances, etc. will reflect the ultrasonic waves. Sound-absorbing materials such as carpets, drapes and soft furniture will reduce the ultrasonic range of the device. Therefore, do not place the device behind drapes or other sound-absorbing material.

Ultrasounds cannot penetrate through hard or solid objects. Rodents behind these types of objects will not be repelled.

Which products to choose to ELIMINATE MICE

MOUSE OUT® Block Mouse Bait Station with warfarin

WHY

To eliminate existing mice and prevent an infestation.

WHERE

For indoor use. Ideally place in suspended ceilings, under floors and in wall cavities, kitchens and bathrooms (near water sources), closets, attics, garages and outbuildings, garden structures, greenhouses, warehouses, and agricultural and farm buildings.

ACTION

Bait stations containing warfarin, an anticoagulant chemical that reduces the blood's ability to clot. After several feedings, mice die from internal bleeding, and your mouse infestation will soon be a thing of the past.

BENEFITS

- Ready to use, no preparation required
- No need to touch the dead mouse to dispose of it
- Safe: child-resistant bait station
- Each package contains 3 disposable bait stations

TIP

Remove any potential food sources from the surrounding area to encourage rodents to consume sufficient quantities of bait. Place multiple bait stations 2 to 5 metres apart.

Which products to choose to ELIMINATE MICE

MOUSE OUT® Reusable Mouse Bait Station with warfarin

WHY

To eliminate existing mice and prevent an infestation.

WHERE

For indoor use. Ideally place in suspended ceilings, under floors and in wall cavities, kitchens and bathrooms (near water sources), closets, attics, garages and outbuildings, garden structures, greenhouses, warehouses, and agricultural and farm buildings.

ACTION

As effective as our Block Mouse Bait Stations with warfarin, with the added benefit of being reusable. Contain warfarin, an anticoagulant chemical that reduces the blood's ability to clot. After several feedings, mice die from internal bleeding.

BENEFITS

- Ready to use, no preparation required
- Contains 16 warfarin bait blocks and a reusable bait station
- No need to touch the dead mouse to dispose of it
- Safe: key-locking, child-resistant bait station

Which products to choose to ELIMINATE MICE

MOUSE OUT® Killer Pellets

WHY

To eliminate mice and quickly get an infestation under control.

WHERE

For indoor use. Ideally place in suspended ceilings, under floors and in wall cavities, kitchens and bathrooms (near water sources), closets, attics, garages and outbuildings, garden structures, greenhouses, warehouses, and agricultural and farm buildings.

ACTION

Mice are attracted to the corn cellulose, the ingredient used to make the rodenticide granules, even though it is harmful to them. Unlike humans and other animals, their digestive system cannot digest the product. The corn cellulose blocks the signals sent to their brain telling them to drink. The rodents quickly become dehydrated and die within just a few days.

BENEFITS

- Ready to use
- Premeasured 60-g packs
- Eliminates mice and other rodents through dehydration
- Organic product, safe for children and pets
- The rapid mummification process associated with dehydration helps prevent odours

TIP

Because mice feed sporadically, it is necessary to place multiple bait stations, spacing them 1.2 to 1.8 metres apart. To prevent the bait from spoiling, avoid placing bait stations near sources of moisture.

Maintain a continuous supply of fresh bait for 6 to 8 days, or until all signs of activity have ceased for at least 2 days.
